Information on the subject of Egyptian monastic dress do frequent all kinds of literary sources. On one hand we come across abbots’ lectures (Pachomius, Shenoute of Atripe) regulating the clothing issue for monks, on the other – various remarks in monasteries related literature (e.g. apophthegmata, Historia Lausiaca by Palladius, Historia Monachorum in Aegypto). Due to the wide diversity of names brought by our sources, sometimes more than one used to describe a single piece of clothing, all attempts at reconstruction must be made carefully.

As many before have conducted an in-depth analysis of the existing texts for clues on that subject, it is unproductive to mention more than a few crucial statements here. The aim of this essay is to further stress the value of the material coming from Coptic cemeteries, enabling us to draw a distinction between the grave of a monk and that of a layman. Archaeological data from Christian nekropoleis in Egypt seem to suggest that the burial’s very location was of no importance. Monastic cemeteries were used universally by the members of local communities, men and women alike. Granted that a large
number of inscribed funerary stelae, clearly belonging to monks\(^3\) have been discovered, they were only very rarely still \textit{in situ} \(^4\) – removed and reused in nearby buildings. Poverty or even total lack of equipment – a feature shared by those early Christian burials, makes any attempt to deduce if the person laid inside belonged to the convent futile. As has been indicated, most data can be therefore derived from the clothing itself.

Needless to say, the trait recognised at first glance is the amount and quality of the fabric. A layman would be usually dressed in a variety of colourful, embroidered clothes – made mostly of linen but sometimes also silk – as in the case of the necropolis of the city Antinoe or cemetery located upon ruined St. Jeremiah monastery at Saqqara\(^5\). One should not expect such finery in monk’s grave – they were buried in what clothes they possessed, the usual fabric being linen\(^6\). Indeed, some texts describe not only the way the cenobites dressed everyday but also what was considered suitable for them in death – a case in point being Letter 30 of Shenoute of atripa, mentioning \textit{three pairs of clothes and two scarfs}\(^7\). These numbers illustrate the rules drawn by Pachomius on the monastic dress code\(^8\).

The number of graves, belonging doubtlessly to monks isn’t large, fine examples being: burials from Deir el-Medinah site\(^9\), from Epiphanius monastery in Western Thebes and St.Mark monastery in Gurnet Marei.

---

\(^3\) As can be observed e.g. on a stele from Asuan (St. Simeon monastery): H. Munier, \textit{Les stèles coptes du Monastère de Saint-Siméon à Assouan}, Aegyptus 11 (1930-31), p. 264, 266, 268, 269.

\(^4\) Interesting examples being the burials of monks (e.g. Apa Kafka, Apa Herakleides), located in the perimeter of a church belonging to Abu Fanā monastery. Votive plates situated above the graves as parts of the floor were decorated (crosses, peacocks) and inscribed with names of deceased. See: H. Buschhausen et all., \textit{Ausgrabungen von Dair Abu Fana in Ägypten im Jahr 1990 (=Dair Abu Fana II)}, Å&W 4 (1994), p. 104-106.

\(^5\) There are two Coptic cemeteries at Saqqara – one located upon the ruins of the monastery mentioned (south of the ramp once leading to the pyramid of Unis), the other in the northern part of the site, near the ancient necropolis for sacred animals.

\(^6\) Draguet, \textit{op.cit.}, p. 109 together with footnote 143.

\(^7\) \textit{Ibidem}, p. 144.

\(^8\) It seems plausible that the correct number of clothes prescribed by Pachomius was three rather than two as occasionally mentioned in the monastic literature (See: Desprez, \textit{Cenobityzm...}, p. 40-41). Praecepta 81, which listed the items a monk could own, says: \textit{two lebitonaria and one worn down by use} – that gives us three tunics, the last one used for work and sleep. St. Jerome in his Preface to Rules by Pachomius mentions \textit{two lebitonaria (which is a garment of Egyptian sort, sleeveless)and one already worn out, to work and sleep}. Similarly \textit{Book of Horsiesius} (chapter 22): \textit{two lebitonaria and another in use}.

\(^9\) At the site of Hathor temple was a monastery and church of St. Isidore.
In 1973 one of the mummies found in Gurnet Marei – a man around 45 years old – has been examined more closely with a detailed register of clothes being created. The monk wore a sleeveless tunic, reaching his ankles and made from a single, rectangular piece of linen (2.26 x 1.3 m), sewn at the sides\(^\text{10}\), with the orifices for head and arms additionally strengthened. A sort of a shirt, hips-length completed the outfit\(^\text{11}\). It is worth mentioning that the clothes were definitely an everyday use item, not one created especially for the deceased\(^\text{12}\). The mummy’s head was covered with a cap made of a rectangular, good quality linen (73 x 45 cm)\(^\text{13}\). When folded in half, one of the longer sides was sewn together, with strings attached to the free corners. Two crosses decorated its back.

Interestingly, the man’s dress included a (ram’s or goat’s) leather apron, covering his chest and tights\(^\text{14}\). Two stripes fixed to the upper corners (36 and 44 cm long, 3 cm wide\(^\text{15}\)) enabled the owner to hang it around his neck. Another piece of leather (ca.73 x 3.6 cm)\(^\text{16}\)circled the waist to be fastened at the back. Embossed with geometric patterns (e.g. concentric circles), it also had a small pocket on the right side, breast-high\(^\text{17}\). The upper part of the apron broadened, the lower one narrowed – protecting the legs, it was cut into three stripes, the middle one with additional cuts\(^\text{18}\). It’s worth mentioning that this last item wasn’t placed immediately on the body but upon ten shrouds protecting it, under the cover of narrow ribbons\(^\text{19}\).

Clothing found in two graves near St. Epiphanius monastery show close similarity to those just described. Here, the leather apron and stripes were also placed atop the layer of shrouds and ribbons\(^\text{20}\), the only exception being grave number 9, where it covered the body. Examples of this kind are known from Deir el-Medinah as well\(^\text{21}\), – a similar item served as an outer cover for the mummmified, linen-wrapped body.

\(^{19}\) *Ibidem*, p. 121, 125 and p. 140-141.

One may reasonably suppose that the garment described above is to be identified with a *melota*, known from literary sources\(^ {22} \). According to those, it was made from the goat’s leather\(^ {23} \) and covered one side\(^ {24} \). In some instances (during meditation or prayer) the lower part of *melota* could be folded and used for sitting down, protecting the tunic lying underneath\(^ {25} \); other times it served as a bag for carrying bread or water. H. Leclercq and a large number of scholars consider the *melota* to be a kind of cape\(^ {26} \). Indeed, our sources differ in their description of it, suggesting that a “leather coat” covered the shoulders or hung from them, uncovering one side\(^ {27} \). Some facts, however need considering here. Firstly, the only leather item found in the graves of Gurnet Marei, Deir el-Medinah or St. Epiphanius monastery is the very apron mentioned above. Secondly, our sources use a variety of names for certain parts of clothing. A coat, covering neck and shoulders called *sabanum* or *palliolum* in Pachomian texts was actually made of linen, not leather\(^ {28} \). Nevertheless, one can suppose a *melota* could be used as a coat or apron. A well known fresco from the Faras cathedral (VII-IX AD)\(^ {29} \) – St. Ammonios of Tuna - shades more light on the matter. The ascetic wears a coat fastened round the waist, narrowing downwards and resting on his right side, which partly corresponds with its description above. The upper part with the pocket and stripes, clearly absent here, seems to be of lesser importance. Our written sources emphasise the use of the lower part – for carrying things and protecting the tunic while sitting down. It is therefore valid to speculate that the design of a *melota* could differ from one to the other – the piece with a pocket added for convenience. Similarly, the cuts visible were there for practical reasons – once tied to the belt at the waist, they formed a sack, used for transport. Otherwise, the end of the strap would have to be supported by hand all the time.

Linen tunic, mentioned in the case of the monk from Gurnet Marei, formed a basis of monastic outfits, both in Pachomian congregation and that of Shenoute, though the design could differ slightly. According to Pachomian texts, so called lebiton was a long, sleeveless cloth made of linen\textsuperscript{30}. There are however reasons to believe that the Shenoutian garment had sleeves\textsuperscript{31}. Therefore the monk from Gurnet Marei represented a group following Pachomian rules – another characteristic feature being the belt\textsuperscript{32}.

As for his head cover, one is tempted to identify it with kukulla worn by both congregations – the word “scarf” used in Shenoutian texts seems to represent a kukulle as well\textsuperscript{33}. Each monk owned two kinds of caps\textsuperscript{34}, marked accordingly and used in the monastery or house he lived in\textsuperscript{35}. Their shape was modelled after children’s caps\textsuperscript{36}, numerous examples of which are to be found in the cemeteries e.g. those from Antinoe, sometimes adorned with a cross\textsuperscript{37}. In one of his essays, R.Draguet contemplates the possibility of wearing a kukulla only with other specific items e.g. a short coat, covering the shoulders (palliolum, sabanum, amictus, maforium) but he almost simultaneously provides arguments against this idea. The cap from Guret Marei seems to indicate, it could be worn independently, with stripes fastened below the chin. The two crosses mark also corresponds with what we can learn from the texts, though

it is worth mentioning that an additional sign, indicating the monk’s congregation, was also placed on the *kukulla*\textsuperscript{38}. *Historia Lausiaca* offers more insight into this problem, recording, apart from crosses, also letters of the Greek alphabet\textsuperscript{39}. Still, one cannot be certain that the markings were placed exclusively on head covers - Palladius does state that the monks were divided into groups distinguishable only by the signs but he does not specify their exact location on clothing. The Gurnet Marei cap is devoid of any markings, though according to some Coptic versions of the text, an ornament was to be placed at the belt\textsuperscript{40}. As for the Faras fresco, a cross sign is adorning the upper part of St. Ammonius cape\textsuperscript{41}. Nothing therefore impedes the notion that an additional sign could not be placed somewhere else than the *kukulla*, still in the case of Gurnet Marei mummy, no such ornament was found.

From the above data we can conclude that any interpretation of the Egyptian monastic dress, based on texts and archaeological sources is seldom clear or unambiguous. In connection with this whole problem, it is worth remembering that close to nothing is known about the types of clothes nuns wore, although the tunic design was probably similar to the one described above. Still, the simplicity of those outfits and their specific elements like *melota* or *kukulle*, let us immediately recognise the grave as that of a monk.
